

Some advertisement about Trevor Lee (Myself)

I have more than 30 years of application / system development working experience in Java and (in recent years) in Python.

Due to my passion for software development, I have many other [personal] development experiences for frontend, backend, Android mobile app, as well as embedded programming for micro-controllers; most of these development work you can check out from my [GitHub repos](#)

Here are some selection personal projects of mine:

- [gen_image_ui](#)
 - Next.js Web UI, with Python backend, for AI Image Generation (and LLM chatting)
 - [Demo of gen_image_ui GitHub repo](#)
- DumbDisplay Android App
 - An Android mobile app for transforming Android phone as a virtual display for micro-controllers like ESP32 / Raspberry Pi Pico
 - [DumbDisplay Android App Google Play Store link](#)
- DumbDisplay Arduino Library
 - An Arduino framework for connecting / making use of DumbDisplay Android App: For transforming Android phone as a virtual display for micro- controllers like ESP32 / Raspberry Pi Pico, for displaying as well as inputting purposes
 - [DumbDisplay Arduino Library GitHub repo](#)
- DumbDisplay MicroPython Library
 - A MicroPython library for framework for the above-mentioned DumbDisplay Android App
 - [DumbDisplay MicroPython Library GitHub repo](#)
 - The library not only works for MicroPython, it works for regular Python 3 as well. You may want to check out the YouTube video -- [An Odd Way to Implement Simple Android Games in Python 3](#)
- A Calculator App
 - A demonstration on how to make use of WASM (Rush implementation) to develop a simple calculator Android app
 - [A Calculator App GitHub repo](#)
- A Weather Clock
 - A micro-controller project to build a clock with micro-controllers like ESP32 / Raspberry Pi Pico. The clock supports 1) showing of weather; 2) showing of time; 3) alarms; and 4) slide-show
 - [A Weather Clock GitHub repo](#)
- PyTorch Introductory Experiments
 - A few introductory PyTorch deep-learning experiments, including one that makes use of the Minst Dataset, via DumbDisplay as inputting devices for testing the end-result of DL model trained from the Mnist Dataset; and one that makes use of AI (deep-learning) to play the classical sliding puzzle game
 - [PyTorch Introductory Experiments GitHub repo](#)
- [rusty_dumb_tools](#)
 - A collection of simple tools in Rust as Rust modules
 - [rusty_dumb_tools GitHub repo](#)

As for my education background: I have three degrees – Bachelor of Computer Science, Master of Science and Master of Arts. I was granted my Bachelor of Computer Science degree by Canada's University of Manitoba back in 1991. I received the gold medal for the degree (Bachelor of Computer Science) that year.

The above advertisement are just to highlight my passion toward technology, especially in software development.

I am currently looking for opportunities to apply my technical skills in software development. I am open to contract / freelance work, on-site in Hong Kong or remote from anywhere in the world. If you are interested in my profile, please feel free to contact me
